Book Review

Robinson, William D. (editor) *The Solid Waste Handbook: A Practical Guide*. John Wiley & Sons, New, York, 1986.

Robinson has brought together a book which is remarkable in several ways. The book is a balanced treatment particularly of planning, management, and technical aspects of solid waste. Unfortunately, this work is most weak in its coverage of matters of health and the environment, although much material on this is implicitly present. Such topics as litter control, bottle bills, and receptacles, which would be of interest to environmentalists, have little or no coverage.

The content of the book reflects current interests in solid waste management. Included are source separation and local recycling programs, recycling of mixed solid waste (with emphasis on energy recovery), and hazardous waste management. The section on hazardous waste primarily describes legislation and regulations, with very little other discussion of current technology. Surprisingly, the section on collection includes little on collection equipment.

The discussion of sanitary landfills includes the expected material regarding types of landfills and operational methods. In addition, however, there is a substantial section on public involvement as a means of coping with opposition from citizens, as well as discussion of leachate control, liner systems, landfill gas, and such methods of processing on-site as shredding and baling. Incineration also is represented, but as part of the discussion of energy recovery.

One should remember that this volume is a handbook, rather than a text. Thus, its form makes it convenient for reference, but less practical for reading from cover to cover. In conclusion, this book belongs on the shelf of the environmentalist who is concerned with solid waste management, but is probably too specialized for the generalist.

Albert F. Iglar, Ph.D.
East Tennessee State University

Chernobyl Report Available From NTIS

The National Technical Information Service has issued a *Report on the Accident at the Chernobyl Nuclear Power Station* compiled from the USSR Report to the International Atomic Agency in August 1986, discussions with Soviet representatives attending that meeting, and a report prepared by the International Nuclear Safety Advisory Group for the Director General of the International Atomic Energy Agency. The report includes a discussion of the design of the Chernobyl Nuclear Station Unit 4, a safety analysis of the unit, the accident scenario, and assessment of the hazards, emergency activities, as well as information on the health and environmental consequences of the accident. The 209 page report is available from NTIS, Springfield, VA 22161. Phone (703) 487-4650.

Radioactive Waste Studied in East

The Northeast Interstate Low-Level Radioactive Waste Commission (New Jersey and Connecticut) has contracted with Roy F. Weston, Inc., to develop a regional low-level radioactive waste management plan by this fall. Waste stream data are being studied and a survey of waste generators will characterize current and projected waste streams. Existing waste management facilities are being reviewed before a determination of need is made for additional facilities and technologies. Planning also includes development of criteria for host state and site selection for future facilities.
